

I need to make four changes to my portfolio homepage. Make all four changes, return the full updated HTML file, and do not modify anything else on the page (keep the nav, status pill, hero stats, work cards, side projects, approach grid, contact section, and footer exactly as they are).

### **Change 1 — Replace the H1 with a rotating-word animation.**

The current heading reads:

Product designer who finds the problem behind the problem.

Replace it with:

I'm a product designer for [ROTATING WORD]

The rotating word cycles through these five phrases, with a 1.8-second delay between each, looping infinitely:

1. enterprise SaaS
2. design systems
3. AI products
4. accessibility-first teams
5. the long game

Animation requirements:

- Each word fades out and the next fades in (300ms fade transition)
- The rotating word should be styled in the Instrument Serif italic + blue (#2B43FF) treatment currently used on the word "problem" in the hero
- Reserve horizontal space for the longest phrase ("accessibility-first teams") so the layout doesn't jump as words change
- On screens narrower than 600px, the rotating word drops to its own line below "I'm a product designer for"
- The rest of the H1 typography (clamp font size, line height, letter-spacing, weight) stays identical to current

Implement the rotation using a single JS interval that swaps the textContent of one `<span>` element. Keep it lightweight — no animation libraries.

### **Change 2 — Replace the paragraph under the heading.**

The current paragraph reads:

I'm Joy Nicolas — twelve years designing enterprise SaaS, design systems, and AI-driven products end-to-end. Most recently at Thinkproject, before that leading UX for Microsoft Data & AI demos at Xoriant. I ship systems that other designers can move faster on top of.

Replace it with:

I'm Joy Nicolas, a product designer based in Pune with twelve years across enterprise SaaS, design systems, and AI-driven interfaces. I've shipped UX for Microsoft's Data & AI demos at Xoriant,

contributed to the shared design system at Thinkproject, and most recently used AI as a coding partner to take two side projects from blank page to deployed in under seven hours each. What I'm best at: spotting the second-order problem in a product — the one nobody's named yet — and building the system that fixes it.

Wrap the final sentence — beginning with "What I'm best at:" — in `<strong>` so it appears slightly heavier, matching how other `<strong>` tags in the paragraph are styled.

### Change 3 — Replace the black scrolling marquee with a company logo strip.

The current marquee is a black bar with scrolling text ("Product design ♦ Design systems ♦ Enterprise SaaS..."). Remove it entirely and replace with a logo strip section.

The new section structure:

- Light background (matches body #FAFAF7, not the dark marquee)
- A small caption line above the logos in mono font, 12px, uppercase, letter-spacing 0.15em, color #888, centered: [ Twelve years, shipped at ]
- Below the caption, a centered headline in Inter, 24-28px, weight 500, color #0A0A0A: The teams I've designed alongside.
- Below the headline, a continuous left-scrolling row of company logos (use the logo image files I'm attaching to this message, in the filename order I've numbered them)
- Each logo sits inside a tile that includes the logo image AND the company name below it in 12px mono, uppercase, letter-spacing 0.1em, color #555
- Logos render in grayscale by default at 70% opacity; on hover, the individual tile transitions to full color and 100% opacity (250ms ease)
- The strip scrolls left at ~50 seconds per loop (slow enough to actually read each name); pause the scroll on hover anywhere over the strip
- Logos should be ~64px tall, company-name caption below adds another ~20px. Tile padding: 12px horizontal, 20px vertical
- The whole section has 80px top padding and 80px bottom padding, with the scrolling strip set to overflow hidden inside a fixed-height container
- Duplicate the logo set inline (render each logo twice in the markup) so the scroll loops seamlessly without a visible jump

Use the actual filenames I've attached for the `<img src>` references. If you cannot read the filenames, list them as `logo-01.png`, `logo-02.png`, etc., and I'll rename my files to match.

### Change 4 — Add a custom vertical-line cursor in brand blue.

Add a custom cursor that follows the mouse and resizes its height based on what type of element it's currently hovering over.

Cursor specifications:

- A vertical line, 3px wide, color #2B43FF, border-radius 2px
- Heights for different contexts:
  - Over an `h1`: 88px tall
  - Over an `h2` or `h3`: 56px tall
  - Over a `p`, `span`, or other body text: 22px tall
  - Over a button or anchor link: 32px tall
  - Default (no specific text element): 16px tall
- The cursor smoothly transitions height when moving between element types (200ms ease)

- Position the cursor centered on the actual native mouse position (the native cursor should be hidden site-wide via `cursor: none` on `body`)
- The cursor must NOT block clicks — apply `pointer-events: none` to the cursor element
- Hide the custom cursor entirely on touch devices (using `@media (hover: none) and (pointer: coarse)` — fall back to the native cursor on mobile and tablets)
- The cursor should fade out when the mouse leaves the viewport and fade back in on re-entry
- Implementation: a single fixed-position `<div>` appended to the body, position updated on `mousemove` using `transform: translate3d( )` for smooth performance, with height changes triggered by `mouseover` events that check the target element's tag name

Return the full updated HTML file with all four changes applied.
